PUBLIC HEALTH OFFICE,

BLACKBURN,

May, 1936.

MR. CHAIRMAN, LADIES AND GENTLEMEN,

I beg to present the Annual Report upon the Health of Blackburn for 1935, which has been compiled on lines indicated by the Ministry of Health.

I would take this opportunity of thanking all members of the Health Department Staff for the zeal and loyalty which they have, one and all, displayed during the year.

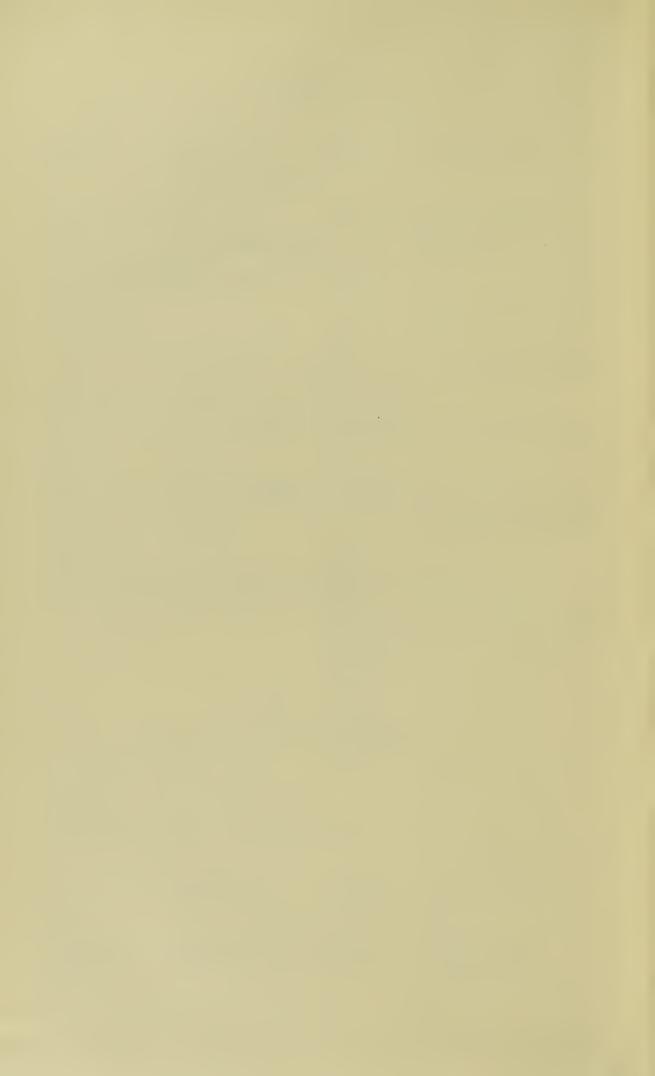

It is once again a privilege to express to the members of the Health Committee my appreciation of the sympathy and interest which they have displayed in the work of this Department.

I am,

Mr. Chairman, Ladies and Gentlemen,

Your obedient servant,

V. T. THIERENS.

Deaths:—The total number of deaths registered was 1,725, of which 886 were males and 839 were females. The death rate was $14 \cdot 5$ per 1,000, compared with $11 \cdot 7$ for England and Wales and $11 \cdot 8$ for the 121 great towns.

CAUSES OF DEATH AND SICKNESS.

During 1935 the chief causes of death were as under:—

Disease.		Ì	No. of	Deaths.	D	eaths pe	er 1,000.
Organie Heart Disease	 	 	182	(217)	• • •	1.54	(1.81)
Pneumonia	 	 • • •	141	(118)		1.19	(0.98)
Cancer	 	 	195	(211)		1.64	(1.76)
Bronehitis	 	 	178	(112)		1.50	(0.93)
Pulmonary Tubereulosis	 	 	79	(67)		0.66	(0.55)

The bracketed figures represent the corresponding number for 1934.

Diseases of bodily systems and group diseases to which death was assigned are as follows:—

Disease.	No. of	Deaths.	D	eaths pe	er 1,000.
Respiratory System (Non-Tubercular:	 335	(240)		$2 \cdot 83$	$(2 \cdot 00)$
Circulatory System	 346	(341)		$2 \cdot 92$	$(2 \cdot 84)$
Nervous System (Non-Tubercular)	 122	(123)		1.03	(1.02)
Caneer	 195	(211)		$1 \cdot 64$	(1.76)
Tuberculosis (all forms)	 96	(78)		0.81	(0.65)
Renal System (Non-Tubercular)	 86	(79)	• · •	$0 \cdot 72$	(0.65)
Infectious Diseases	 65	(33)		0.55	$(0 \cdot 27)$
Digestive Diseases	 83	(69)		0.70	(0.57)
Diseases of Babyhood (under one year)	 52	(59)		$0 \cdot 44$	(0.49)
Diseases associated with Maternity	 7	(9)	• • •	0.05	(0.07)

The bracketed figures represent the corresponding number for 1934.

CANCER.

The deaths from Cancer numbered 195, as compared with 211 in 1934 . 202 in 1933; 202 in 1932; 213 in 1931; 185 in 1930; 192 in 1929; 163 in 1928; 160 in 1927.

The Death Rates from Cancer per 1,000 of the population for the past 12 years are as under:—

1924			$1 \cdot 42$	1930		 1 48
1925			$1 \cdot 26$	1931		 1.71
1926	•••	• • •	$1 \cdot 33$	1932		 1.65
1927		• •	$1 \cdot 28$	1933	• • •	 1.66
1928		• •	$1 \cdot 30$	1934		 1.76
1929	•••		$1 \cdot 53$	1935		 1.64

During the past year the attendance at the Clinic has been maintained, and patients are recognising the importance of attending for examination regularly. It is now four years since the Clinic was inaugurated, and the results of treatment by radium are becoming more manifest. Although no actual statistics can be given until five years have clapsed from the commencement of treatment the results at the present time appear to be quite satisfactory.

I wish to acknowledge my indebtedness to the Radium Institute, Manchester, for their kindness in showing me the latest methods of treatment. It is now quite certain that Radium treatment should be used in conjunction with deep X-ray Therapy, and treatments in the latter department are rapidly increasing."

J. KEITH CUMMING, M.B., CH.B. (ABERDEEN)."

MORTALITY STATISTICS IN COTTON OPERATIVES.

The subjoined Tables are a continuation of those given in previous reports.

Mental	2	66	94		169	
Other	• • •	7			7	
TOTAL	18	247	314	141	702	

The Hospital is a reeognised training school for nurses.

(b) VOLUNTARY HOSPITALS.

The Blackburn and East Lancashire Royal Infirmary has accommodation for 244 in-patients. The beds are allotted as under:—

	Males.		Females.
General Medical	10		14
General Surgical	85		83
Children	11		11
Venereal Disease	2		2
Eye, Ear, Nose & Throat	11		15
TOTAL	119	***	125

AMBULANCE FACILITIES.

(1) For Infectious Cases:—

The Health Committee provide Two Motor Ambulanees.

(2) For Non-Infectious Cases: -

Three Motor Ambulances are available, one provided by the Wateh Committee, one by the Joint Committee of the British Red Cross Society and the St. John Ambulance Brigade, and one by the Public Assistance Committee.

The Ambulanee Service is fully adequate for the needs of the Area.

PUBLIC ASSISTANCE.

I am indebted to Mr. C. B. Pye, Public Assistance Officer, for the appended particulars.

No. of residents in the County Borough in receipt of out-door relief: --

1st January, 1935 ... 2319 families comprising 4605 persons.

1st July, 1935 ... 2092 families comprising 3879 persons.

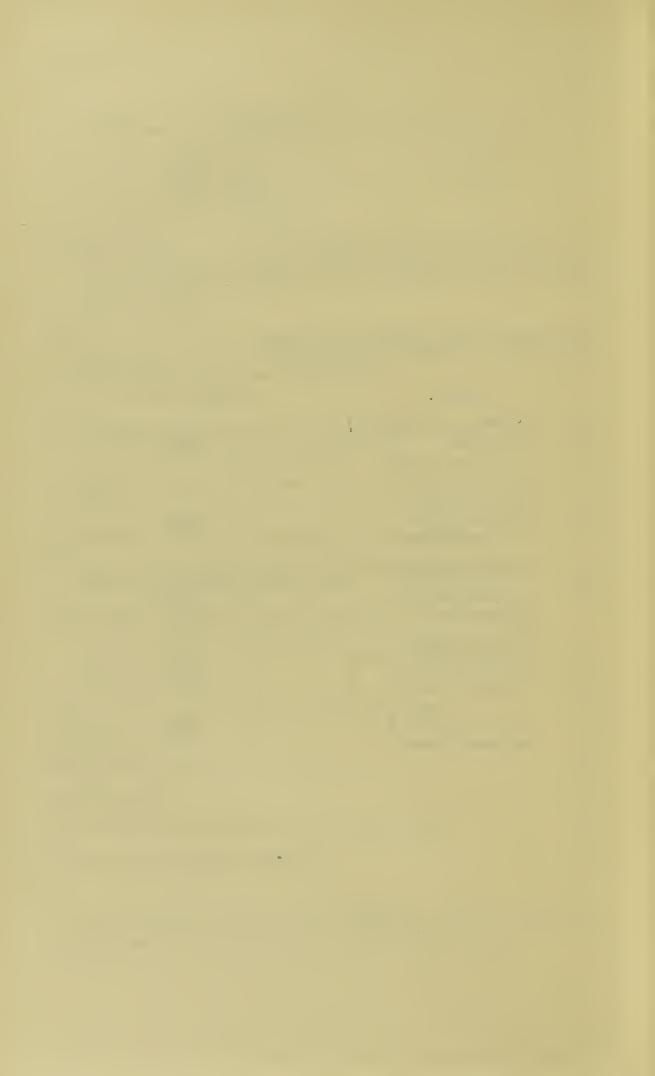

lst January, 1936 ... 2233 families, eomprising 4240 persons.

No. of Blackburn persons relieved on the 1st January, 1936, in the							
. Institution 725							
Cottage Homes 52							
Working Boys' Home 9							
In addition there are a number of persons in the Institution, Cottage Homes and the Working Boys' Home who are chargeable to the Laneashire County Council.							
Expenditure on out-relief to Blackburn persons during the 12 months ended 30th September, 1935, was £66,527/19/4.							
No. of Blackburn persons in Queen's Park Hospital on the 1st January, 1936, included in the 725 mentioned above 358							
Average No. of Blackburn persons in the Cottage Homes during 1935 (per day) 61							
Total number of Beds in the Institution, 1st January, 1936 1243							
Total number of Inmates on the same day (including persons chargeable to the Lancashire County Council) 1028							
Total number of Inmates of the Institution on the 1st January, 1936, who were suffering from sickness, aceident, bodily or mental infirmity, including aged and infirm persons requiring regular							
nursing care or treatment 994							
Total number of Sick Children on the 1st January, 1935 107							
Admitted during 1935 672							
Diseharged during 1935 590							
Died during 1935 63							
Total number of Siek Children on the 1st January, 1936 126							

There has been no change in the administration of Poor Law Medical Out-relief since the service was transferred to the Local Authority.

The districts, with populations, are as under:—

Districts.			Popul	ation 1931.

PART II.

Sanitary Circumstances.

WATER SUPPLY.

The town is supplied with an upland surface water, which has been satisfactory, both as regards quantity and chemical and bacteriological purity.

Appended are representative reports of baeteriological and chemical examinations carried out during the year:—

Numerical results expressed in parts per 100,000:

(a) CHEMICAL.

Colour: Dark Green. Turbidity: Very Slight. Smell: None. Oxygen absorbed 0.082Hardness: Clarke's Method: (4 hours at 27° C.) Temporary Free and Saline Ammonia 0.0068Permanent $3 \cdot 15$ as NH₃ Total 3.9 Albuminoid Ammonia 0.0148Reaction, pH $6 \cdot 5$. . . as NH. Action on Lead 0.08Nitrous Nitrogen 24 hours. nil. as NH, Metals Nil.

Nitric Nitrogen 0.057 as NH₃

Chlorides 1·4 as Cl.

(b) BACTERIOLOGICAL.

Quantitative Analysis—

Average Results of Four Examinations.

Acrobic micro-organisms growing in nutrient gelatine in 3 days at 20° C.

No. of Colonies in 1 gramme (15.43 grains) of water.

Non-liquefying bacteria 70Liquefying bacteria... 120 Total 190

Ærobic micro-organisms growing on standard agar in 48 hours at 37° C. 37

Quantity of water in which these bacteria were—

Qualitative Analysis. found not found

Bacteria associated with sewage or fæcal pollution ... Bacillus coli 100 cc. ... 10 cc.

Samples of water, taken at the reservoir outlets, are ehemically and bacteriologically examined at least once in each month.

OVERCROWDING.

For the purposes of the survey required by the Housing Act, 1935, a temporary staff of 24 enumerators and surveyors, together with one additional sanitary inspector, were engaged. The staff completed their task within ten weeks.

Analysis of the preliminary enumeration returns (which gave particulars of the number of persons and rooms in each house in the Borough) called for a detailed survey of 1,600 houses, all the habitable rooms in which were measured.

It was thus ascertained that 383, or $1\cdot09\%$ of all the houses in the Borough were overcrowded.

The appended Tables give particulars of the extent of overcrowding, both for the Borough as a whole and for Corporation-owned property.

The "standard of overcrowding" is defined in Section 2 of the Act, and provides that the available accommodation shall permit of satisfactory sexseparation in sleeping rooms, and also that the capacity of the house shall be adequate for the number of occupants. Adequacy of capacity is to be determined in one of two ways defined in the First Schedule of the Act as under:—

TABLE I.

Wh	ere a house consi	sts of		Th	e perm	itted number of persons is
(a)	One room		 •••			2
(b)	Two rooms	•••	 •••		•••	3
(e)	Three rooms		 •••			5
(d)	Four rooms		 			$7\frac{1}{2}$
(e)	Five rooms or	more	 •••	• • •		10 with an additional two
			,			in respect of each room in excess of five.

(In using this Table, a room less than 50 square feet is not counted as a room).

TABLE 2.

$Wh\epsilon$	ere a room in a house has a floor area	a of—	Th	ie permi	tted	number	of persons is—
(a)	110 sq. feet or more		•••	•••	•••		2
(b)	90 sq. feet or more, but less than	110					$1\frac{1}{2}$
(e)	70 sq. feet or more, but less than	90	•••		•••	•••	1
(d)	50 sq. feet or more, but less than	70	•••				1/2
(e)	under 50 sq. feet	•••	•••	•••	•••	•••	Nil.

In applying Table 2, each room of the size mentioned is to be held as capable of accommodating the number set out in the Table, and the aggregate for all the rooms in the house is ascertained in this manner. The "permitted number" for the house is the aggregate number so obtained, or the number given by Table 1, whichever is the smaller.

In assessing the number of persons in a house a child under the age of one year is to be counted as "nil," and one between the ages of 1 and 10 years as half-a-unit.

In the application of the above Tables, all habitable rooms over 50 square feet in area which are normally used either as living rooms or bedrooms, have to be taken as being available for sleeping purposes, and the overcrowding figure for the Borough has been calculated on that basis. The survey revealed, however, that in the case of 3,375 dwellings, bedroom overcrowding would prevail unless a living-room, or living-rooms, be used for sleeping purposes. Our experience has shown that many families so housed are, not unnaturally, loath to sacrifice a comfortably furnished sitting or living-room to sleeping purposes, but endeavour to secure some sort of bedroom privacy by means of screens or improvised partitions, whereby actual, though not statutory, overcrowding will prevail.

At the time of the survey there were 170 empty houses (of a rateable value of £15 nett or less) in the Borough. The Committee considered that dwellings of a higher rateable value than £15 would be, generally, beyond the financial reach of members of the working classes.

Assuming that these 170 dwellings will be available for decrowding purposes, and having regard to the houses which will be left vacant after rehousing families shown to be overcrowded, only thirty-five large-type houses will be required to be erected by the Corporation.

At the time of writing this Report, negotiations are proceeding with the Property Owners' Association whereby it is hoped that many of the empty houses in the Borough will become available for decrowding purposes.

HOUSING CONDITIONS.

The policy of reconditioning has been continued throughout the year. Up to December 31st, 1935, 1,050 houses have been dealt with, and approximately 250 houses are in the process of reconditioning.

HOUSES-LET-IN-LODGINGS.

The number (80) of houses-let-in-lodgings is more than in 1934, when 78 such houses were on the register. These houses provide 461 rooms, of which 73% were occupied, compared with 463 rooms, and 75% occupancy in 1934. Although the majority of the houses comply with the bye-laws, the accommodation provided is, generally speaking, unsatisfactory, and in the absence of additional legislation will ever remain so.

COMMON LODGING HOUSES.

There are 16 Common Lodging Houses in the Borough, which provide accommodation for 642 persons.

In all these houses the domestic conveniences are of a much higher standard than those provided at the majority of houses let in lodgings. Facilities for the storing and preparation of food, for personal ablution, etc., are in most cases satisfactory.

The bye-laws relating to these premises are adequate.

TENTS, SHEDS, CARAVANS, ETC.

At the end of the year there were 46 caravans in the Borough used as human habitations.

Constant sanitary survey is necessary if the caravans and their surroundings are to be kept in a cleanly and sanitary state.

The general cleanliness of the travelling vans which came to Blackburn during the Easter holidays was satisfactory.

The bye-laws in force are adequate.

CANAL BOATS ACTS, 1877 AND 1884.

The Corporation of Blackburn, as the Urban Sanitary Anthority for the district of the said Borough, beg to report that during the past year they have carried into execution within their district the provisions of the Canal Boats Acts.

- (1) They have maintained in office an Inspector, Mr. Herbert Kenyon, appointed for the execution of the said Acts. Canal boats passing through the district have been regularly examined with a view to ascertaining if the Acts were being carried out.
- (2) Seventy-five canal boats have been inspected and reported upon.
- (3) One infringement of the Acts has some under the notice of the Inspector namely:—
 - (a) Boat not properly marked.
- (4) There has been no oceasion to take legal proceedings.
- (5) One statutory notice has been served notifying the owners of the infringement, and the requirement has been carried out.
- (6) & (7) No case of infectious disease has been met with and there has been no dotention of boats for cleansing or disinfection.
 - (8) (a) There are forty-one boats on the Register which are in use or available;
 - (b) Three boats have been broken up.
 - (9) One boat has been re-registered through change of owners.
 - (10) In the seventy-five boats met with there were 147 males, 7 females, and 0 children.

OFFENSIVE TRADES.

The number of offensive trades within the Borough is 28, of which 16 are bone, and rag and bone dealing, four are fat extraction or fat rendering, two are gut-scraping, four are tripe-boiling, and two knackering.

Nuisances arising in connection with offensive trades are influenced by the amount of care exercised in the storage of the raw material and waste products. Careless methods of storage and production have been responsible for the majority of nuisances reported, and attention paid to these details has resulted generally in abatement of the nuisance complained of.

SWIMMING POOLS AND BATHS.

There are no privately owned swimming-pools or baths in Blackburn.

Three swimming baths are owned by the Corporation at which the water is treated by continuous filtration and chemicals. Consideration is being given to speeding up the filtration process.

SCAVENGING AND PUBLIC CLEANSING.

The arrangements for scavenging and public cleansing are similar to those described in the Report for 1933.

SANITARY INSPECTION OF THE AREA.

The appended Tables classify, in tabular form, inspections carried out by the Sanitary Inspectors during the year, their findings and action taken in respect thereof.

FACTORIES AND WORKSHOPS.

TABLE 18.

This Table eontains particulars of matters referred by the Factory Inspector and of action taken by the Health Department in respect thereof:—

FACTORIES.

"Sanitary Accommodation: The accommodation for women was not suitable, in that catches were not provided on the doors of the conveniences."

Notice sent and bolts were fitted.

"Sanitary Accommodation: No sanitary convenience provided for the two men employed."

A suitable sanitary convenience on the same premises was provided.

"Sanitary Accommodation: Separate conveniences were not provided for the employees of both sexes." (Ten men and ten women employed).

Notice was sent and satisfactory sanitary conveniences were erected.

"Sanitary Accommodation: No sanitary convenience is provided at this works conveniently accessible to the persons employed."

Notice was sent and access was provided to an existing sanitary convenience.

"Sanitary convenience not ventilated and not provided with a door fastening."

Work carried out on receipt of notice.

Bakehouses and Workshops.

"Limewashing overduc."

Notice sent. Work completed.

"Limewashing overdue."

Notice sent. Work completed.

"Sanitary Accommodation: Separate accommodation not provided for the one female employed."

A screen and a bolt to the door of the existing sanitary convenience was provided.

"Limewashing of bakehouse was overdue."

Limowashing completed. Notice not required.

"Sanitary Accommodation: The sanitary convenience was not ventilated to the outside air, and was not adequately lighted. Ventilation: No means provided for removing the fumes from the gas iron heater and oil stove.

Notice was sent, but the work has not yet been completed.

SMOKE OBSERVATIONS.

During the year 37 smoke observations were made, and in one smoke was emitted in excessive quantities. In this instance the premises were visited by the sanitary inspector, who gave verbal notice to abate, investigated the cause and advised as to prevention.

The standards of smoke permissible from a factory chimney in Blackburn are as follows:—

One boiler	• •		 4 mir	nutes bla	ck smok	e in the ho	u r
Two boilers			 5	ο	,,	,,	
Three boilers			 6	,,			
Four boilers or m	nore	• •	 7	**	.,	.,

Much valuable information regarding the existence of non-notifiable infectious disease has reached the Health Office through the agency of Head Teachers and School Attendance Officers.

Convalescents from infectious disease and contacts who have been excluded from school are not readmitted until the Head Teacher receives a clearance certificate issued by the Health Department or the private practitioner in attendance. Children convalescent from infectious disease are excluded from school for varying periods following discharge from hospital, or, in the case of children who have been nursed at home, following disinfection of the home.

The period of exclusion of contacts depends upon the type of infectious disease.

Water at the Schools is drawn from the Corporation mains and is satisfactory as regards quantity and quality.

A sanitary survey of each school is made three times each year by the Assistant School Medical Officer, who reports thereon to the School Medical Officer who is also Medical Officer of Health. Any sanitary defects found are reported to the Education Authority, who take such action as may be necessary.

Absences from selicol due to sickness are reported to the School Medical Department through the School Attendance Officers.

A full survey of the health of the school-child is contained in the Annual Report on the work of the School Medical Service.

THE RAG FLOCK ACTS, 1911 & 1928.

There is one premises in Blackburn where rag-flock is used. The flock is not manufactured locally, but is purchased under guarantee of Government Standard of Cleanliness.

The premises concerned have been visited in the course of routine district inspections.

DISPOSAL OF THE DEAD.

The arrangements for the disposal of the dead will remain adequate for at least a further ten years.

PART III.

Food Supply.

REPORT OF THE VETERINARY INSPECTOR

(Mr. E. J. Burndred, M.R.C.V.S., D.V.H.)

FARM AND DAIRY CATTLE INSPECTION.

During the year 248 visits were paid to farms; 442 cowsheds were inspected, and the mammary glands of 5,791 cows examined.

One cow, on a farm in the Borough, was found to be affected with tubereulosis of the udder. It was slaughtered, and on post mortem examination, was classed as advanced tuberculosis.

Three cases of Tuberculosis with cough in three cows were reported by 'the owners, and confirmed on clinical examination.

The three cows were slaughtered, and on post mortem examination the disease was found to be advanced.

None of these showed lesions in the udder, but if left in the herds they would most probably have developed udder lesions later.

Five cases of tuberculous emaciation in cows were dealt with. The animals were slaughtered, and post mortem examination revealed advanced tuberculosis.

Eleven cows were found to be affected with mastitis in one or more quarters of the udder, and in these eases the milk was not used for human consumption during the affection.

Dairies, Cowsheds and Milkshops.

Regular visits were paid to all producing and retailing premises in Blackburn, and many visits were paid in conjunction with, and by the courtesy of, the local officials, to milk-producing premises outside the Borough which supply milk for consumption in Blackburn.

The majority of the producers now recognise the necessity for cleanliness, but do not yet realise the great value of sterilization of the utensils by means of steam.

The impression is general that only graded producers require modern conditions of production.

CLEAN MILK COMPETITION.

There are four elasses of competitors for the Clean Milk Awards.

A silver cup is awarded in each class, and this is held by the winner for one year. He also receives a miniature cup and gold medal, which he retains.

Class I. is open to producers of raw, designated milks, purveyed in Blackburn. The award in this class is the "Redmayne" Cup.

The winner for 1935 was W. Harrison, Home Farm, Dutton.

Class II. is open to producers of non-designated milks, purveyed in Blackburn. The award in this class is the "Porritt" Cup.

The winner for 1935 was A. Threlkeld, Hatchwood Farm, Hoghton.

Class III. is open to producers of designated milks whose main source of livelihood is dairy farming; a trophy is awarded for the best farm, the award being the "Burke" Cup.

The winner for 1935 was W. Harrison, Home Farm, Dutton.

Class IV. is for the best undesignated dairy farm, under the same conditions as Class III.

The winner for 1935 was R. Townson, Magnols Farm, Oswaldtwistle.

Mr. Arthur Holgate, of Moreton Hall, Whalley, was the judge for Classes 111 and 1V.

It is with great regret that I have to record his death at sea shortly after our last visit to the farms together.

MILK (SPECIAL DESIGNATIONS) ORDER, 1923.

Certified Milk. Two producers holding the Certificate of the Ministry of Health supply certified milk in Blackburn. One is situated some distance away, consequently the milk is not delivered the same day as produced. The price is $7\frac{1}{2}$ d, per pint from one farm, and 4d, per pint from the other. The producer who retails at 4d, is now also "attested," the highest possible designation.

Grade A (Tuberculin tested) Milk is used at the Corporation Hospitals.

Grade A Milk. There are 21 farms in the district supplying milk in the Borough which is either Grade A or Accredited; six of these are in the Borough.

There are 12 retailers of Grade A milk.

The price is usually ½d. per pint more than ordinary milk.

Pasteurised Milk.—Two dairies in the Borough are licensed for the pasteurisation of milk. The local Co-operative Society obtains pasteurised milk from a joint dairy situated a few miles from Blackburn. Other dairies obtain supplies from licensed establishments outside Blackburn.

Sterilised Milk, which is not a designated milk, comes into Blackburn from a number of factorics outside.

BACTERIOLOGICAL EXAMINATION OF MILK.

(a) B. Coli.

Two hundred and twenty-one mixed samples of milk were submitted to the Bacteriologist, Public Health Laboratories, Liverpool. The following is a summary of the results.

Bacillus Coli Content :-

Not found	l in 1 cubic cer	ntimetre	••	• •		 	 125
Found in	1 c.c. only	• •				 	 47
,,	0·1 c.c.	••				 	 20
,,	0.01 c.c.				••	 	 19
,,	0.001 c.c.	••	• •		• •	 	 10

The presence of bacillus eoli, or a member of its group, is evidence of manurial contamination of the milk.

The above results show $56\cdot 56\%$ clean; $30\cdot 3\%$ with slight contamination; and $13\cdot 1\%$ grossly contaminated.

The appended Table gives particulars of B. Coli eounts month by month.

It will be noted that the heaviest contamination takes place in June, when the cows are out at grass night and day, and October and November, when the cows are out at grass in the daytime and housed at night. The latter is a very difficult time as the fæces are more fluid than usual.

Tubercle Bacilli. One hundred and eighty-three samples of milk were taken and examined for the presence of tubercle bacilli. The samples were made up as follows:—

One hundred and eighty mixed samples were taken in the eourse of delivery; three samples were taken direct from the udders of eows showing some abnormality of the udder.

Of the 180 mixed samples taken, eleven contained tubercle bacilli; 161 were negative; and in 8 eases the experimental animal died before a definite diagnosis could be made.

All three special samples were negative.

The 11 mixed samples which contained tuberele bacilli were from 10 farms in the County Area. Two of them, however, were taken from the same farm: the second one before the first had been investigated. This should therefore be classed as one infection. Two of the other positive samples were found on investigation to come from one common supply. These must also, therefore, be classed as one infection.

There were then nine sources of milk supply in 178 which contained tubercle bacilli, a percentage of $5\cdot05$.

This percentage is extremely high for Blackburn, and can probably be accounted for as follows:—

- (1) The economic position has affected the producers, with the result that cows are not being changed so frequently as formerly. The older eow is more susceptible to udder infection.
- (2) The Milk Marketing Board's operations appears to have had the same effect; the retention of older eows giving a greater volume of milk.
- (3) The subsidy of the Cattle Committee for the slaughter of heifers and eow heifers also appears to have assisted in this vicious process.

The nine sources of tubercle infected milk were investigated by County Veterinary Officers, and I was present at each examination of the cows. As a result two cows showing clinical signs of tuberculosis, and nine giving milk contaminated with tubercle bacilli were discovered and slaughtered.

Mixed samples of milk supplied to the Royal Infirmary and the Corporation hospitals were taken periodically and examined for the presence of tuberculosis. All the samples were negative.

EXAMINATION OF MILK FOR DIRT.

The samples examined for dirt were filtered through cotton wool discs, the latter being mounted and dried. They were then available for records and for demonstration to producers.

Letters are sent to purveyors of contaminated milk, and wherever possible, visits are paid to the producing premises.

In the County Area the majority of the officials are very helpful.

During the year 809 samples of milk were taken and examined for the presence of dirt.

One hundred and forty-four of these samples were from producer-retailers whose premises are in the Borough. They were classified as follows:—

Clean	 	• • •	31 or	21.52%
Fairly Clean	 	•••	76 or	$52 \cdot 77\%$
Centaminated			34 or	23.61%
Grossly Contaminated	 		2 or	1.38%
Very Grossly Contaminated	 		1 or	0.7%

Four hundred and eighty-eight samples were taken from producer retailers whose premises are in the County Area.

Clean			 	 135)i°	27.66%
Fairly Clean			 	 273	r	$55 \cdot 94\%$
Contaminated	• • •		 	 77 (r	15.77%
Grossly Contam	inated		 	 1 (H.	$0 \cdot 2^{0}$
Very Grossly C	ontami	nated	 • • •	 2 (r	0.41%

Fifty-two samples were taken from retailers who reside in the Borough, but who procure their supplies from producers whose premises are, for the most part, outside the Borough.

Clean		 		 5	or	9.6100
Pairly Clean		 		 1 31	or	59.61%
Contaminated		 	•••	 13	or	25.00%
Grossly Contan	ninated	 		 3	Ol'	5.76%

Fifteen samples were taken from retailers whose premises are outside the Borough.

Clean	•••	•••	•••	 •••	4 or	26.66%
Fairly Clean				 	9 or	60.00%
Contaminated				 	2 or	13.33%

One hundred and ten samples were taken from wholesale producers at the dairies supplied by them before the milk was handed over:—

Clean	• • •	 	 	0	or	0.00%
Fairly Clean		 	 	55	or	$50.00\frac{07}{70}$
Contaminated		 •••	 	51	or•	$46 \cdot 36^{\circ}_{\circ}$
Grossly Contan	ninated	 	 	4	or	3 · 63 ° °

CHEMICAL ANALYSIS OF MILK.

Two hundred and forty-six samples of milk, 206 of which were informal were taken during the year and examined at the Public Health Laboratory, Liverpool. Eleven samples, or $4\cdot47\%$, were reported not to conform with the standard prescribed by the Ministry of Agriculture. If an informal sample proves to be not genuine on analysis, a formal sample is purchased and submitted to the analyst.

PUBLIC HEALTH (PREVENTION OF TUBERCULOSIS) REGULATIONS, 1925.

No action was necessary with regard to tuberculous employees in the Milk Trade.

THE PUBLIC HEALTH (CONDENSED MILK) REGULATIONS, 1923 & 1927.

Sixteen samples were purchased under the above regulations, and all were found, on analysis, to be genuine. All were properly labelled.

These samples are included in Table 30, Food and Drugs (Adulteration) Act.

THE ARTIFICIAL CREAM ACT, 1929.

No action has been taken under the above Act.

THE PUBLIC HEALTH (DRIED MILK) REGULATIONS, 1923 & 1927.

No action has been taken under the above Regulations.

Section 80 Blackburn Corporation Act, 1922. Food Preparing Premises.

This Section reads as follows:—

"Any premises ordinarily used, or proposed to be ordinarily used, for the preparation or manufacture of sausages, pressed, potted or preserved meat, fish or other food, intended for the purposes of sale, shall be registered by the owner or occupier thereof with the Corporation from time to time in such manner as they may direct, and no premises shall be used for the purposes aforesaid unless the same are so registered, and the Corporation shall have power to refuse registration of any premises where the conditions are unsuitable."

There are 46 premises registered under the above section, and in addition there are a large number of food preparing premises which are exempt from registration.

Two hundred and ninety-six visits were made to such premises. Generally they were found to comply with requirements.

In certain eases, the necessity for repairs was pointed out, and in other eases suggestions for improvements were made and in all eases improvements were effected.

DISEASES OF ANIMALS ACTS AND ORDERS.

Foot and Mouth Disease. There were 56 outbreaks in Great Britain necessitating the slaughter of 12,444 animals which had been exposed to infection.

Owing to an outbreak which occurred within 15 miles, Blackburn was included, for a period, in a scheduled area, in which only animals for immediate slaughter could be exposed at the Cattle Market, and the usual restrictions on movement of animals were imposed.

Anthrax. There were 386 outbreaks in Great Britain, affecting 443 animals.

Two suspected outbreaks were investigated in Blackburn. In one ease after special tests the disease was not confirmed. The other case, in a cow at a farm, was confirmed by microscopical examination. The carease was removed to the Audley Destructor, where it was cremated. Thorough disinfection of the premises was carried out and the stock was kept under observation until all danger of further infection was past.

Routine microscopical examination of blood smears from carcases of animals arriving at the Abattoir and Railway Siding in a dead or dying condition was carried out.

Glanders. No cases of this disease have occurred in this country since 1928.

Sheep Scab. No eases occurred in Blackburn, but extensive examinations of flocks in the surrounding areas were carried out by County Officials.

Special regulations are in force in Blackburn to prevent the spread of the disease.

There were 475 outbreaks in Great Britain.

Parasitic Mange. No cases occurred in Blackburn; 99 outbreaks were reported in Great Britain, involving 222 animals.

Swine Fever. The Lancashire Swine Fever Infected Area Order of 1934 was withdrawn on June 10th, 1935. There were eight reports of the deaths of pigs investigated, but in no case was swine fever discovered.

On four occasions during the year swinc fever was discovered in the carcases of pigs sent to the Public Abattoirs for slaughter.

Altogether 16 carcases were destroyed.

Two thousand and forty-eight outbreaks were confirmed in Great Britain.

Tuberculosis. One case of tuberculosis of the udder; three cases of elinical tuberculosis with cough; and five cases of tuberculous emaciation were dealt with under the Tuberculosis Order, 1925.

On post mortem examination they were all classed as advanced.

Cattle Market. The approximate number of animals exposed for sale was:—

MEAT INSPECTION.

The disease which causes most loss to the Meat Industry through condemnation is tuberculosis.

The number of susceptible animals (cattle, calves, pigs) affected with tuberculosis during 1935 was 883, or 4.98%.

Corresponding percentages were :—1934, $4\cdot1\%$; 1933, $3\cdot1\%$; 1932, $3\cdot35\%$, 1931, $3\cdot43\%$; 1930, $2\cdot38\%$; 1929, $2\cdot22\%$; 1928, $2\cdot9\%$; 1927, $2\cdot079\%$; 1926, $2\cdot15\%$; 1925, $1\cdot83\%$; 1924, $1\cdot87\%$.

Of 1,064 cows slaughtered, 194, or $18 \cdot 2 \%$ were found to be affected with tuberculosis in some degree.

Of 306 heifers, only 4, or 1.3%, were affected.

Of 1,848 bulls, 75, or $4 \cdot 2\%$ were affected.

Of 5,446 bullocks, 37, or 0.6%, were affected.

Out of 1,708 calves slaughtered, 2, or 0.1%, were affected.

Of 7,345 pigs slaughtered, 571, or $7 \cdot 7\%$ were affected.

The percentage for pigs in 1934 was $5\cdot6\%$, and in 1933 was $2\cdot5\%$.

The number of carcases in which the disease was so advanced as to necessitate total condemnation was 129, compared with 89 in 1934, 80 in 1933, 84 in 1932, 90 in 1931, 68 in 1930, 84 in 1929, 111 in 1928, 107 in 1927, 107 in 1926, 69 in 1925, 85 in 1924.

In 1935, 63 carcases of cattle were totally condemned as being unfit for human food, and of these, 58 were affected with tubereulosis.

The improvement in fluke infestation of livers was maintained.

The number of livers condemned owing to this disease was 4,808, compared with 6,195 in 1934, 7741 in 1933, 9019 in 1932, 6579 in 1931, 5247 in 1930, 6249 in 1929, 6042 in 1928, and 3836 in 1927.

Tuberculosis in Poultry. This disease is obviously a great source of loss to the industry and continues to increase.

Regular visits were made during the year to the one private slaughter-house in the Borough; to butchers and other meat shops; to food preparing premises; to the wholesale and retail fish markets; and to the meat market.

There was an increase in the number of eattle slaughtered at the Public Abattoirs compared with 1934, but a decrease in the number of sheep, calves, and pigs.

E. J. BURNDRED, Veterinary and Chief Meat Inspector.

THE FOOD AND DRUGS (ADULTERATION) ACT, 1928.

The Public Analyst is Professor W. H. Roberts, M.Sc., F.I.C. Samples taken under the above Acts are submitted to him for examination at the Public Health Laboratory, Liverpool.

The number of samples examined during 1935 was 417. Nine, or $3\cdot35\%$, of the total proved, on examination, to be adulterated, or not up to standard.

FERTILISERS AND FEEDING STUFFS ACT, 1926.

Eleven samples of feeding stuffs and fertilisers were examined by the Analyst during the year. Of these, seven conformed with the statutory statement and four failed to do so. The vendors of the samples were informed of the difference between the actual composition and the composition as defined in the statutory statement, and the deficiency or excess was pointed out, and in the case of the formal samples the Ministry of Agriculture were informed.

The appended Table gives particulars of work done under the Aet:-

MERCHANDISE MARKS ACT, 1926.

Every endeavour has been made to give publicity to the provisions of the above Act.

Three thousand and seventy-two visits were made to premises, and personal warnings given by the Inspector in 214 instances.

SHELL FISH.

Samples of oysters, kindly examined by the Worshipful Company of Fishmongers, were found to be 90% elean.

Several samples of mussels were examined, certain of which gave unsatisfactory results. Appropriate action was taken.

ICE CREAM.

There are 132 iee-eream preparing premises in Blackburn, to which 740 visits were paid during the year. Cleansing and whitewashing has been carried out at all of the premises, and in seven instances new premises have been obtained and the sanitary conditions brought up-to-date.

It has been pointed out previously that there is no standard in this country for ice cream.

This applies not only to the constituents, but also to the purity of the product.

The lack of control is also evident from the variety of premises which are used for its manufacture.

Thirty-three samples were taken for chemical analysis, and 29 samples were taken for bacteriological examination.

The fat content ranged from $13 \cdot 9\%$, a true ice cream, to $1 \cdot 1\%$, which is not of much food value.

Bacterial counts varied from 300 bacteria per e.e. with B. Coli absent in 1 c.e., to more than 500,000 bacteria per e.e., with B. Coli present in 1/1000 e.c.

Every endeavour is being made to provide premises, self-contained, and separate from living premises, on lines similar to those adopted for dairies.

During the year seven such premises were provided, which are admirable for their purpose, but, until registration is required and enforced, there will always be premises used which, to say the least, are undesirable.

PART IV.

SCARLET FEVER.

During 1935, 364 cases of searlet fever were notified, an incidence of 3.07 cases per 1,000 living. Two hundred and sixty-nine cases, or 73.9% of those notified, were removed to the Hospital.

The majority of the eases were mild, only one Borough death occurring a figure equivalent to a case mortality rate of 0.27%.

As in 1934 the heaviest incidence was amongst the 5–15 age group where 216 cases, or $59\cdot3\%$ of the total notified, occurred.

Scarlet fever anti-toxin is supplied free of charge to practitioners desirous of passively immunising immediate contacts of the disease.

Although no definite scheme exists for active immunisation against scarlet fever, 12 persons were Dick-tested during the year.

DIPHTHERIA.

During the year 163 eases of diphtheria were notified, a figure equivalent to an attack rate of $1\cdot37$ per 1,000 of population. There were 23 deaths, giving a mortality rate of $14\cdot1$ per 100 eases notified.

One hundred and fifty-five eases, or $95\cdot1\%$ of the total notified, were removed to Hospital.

The disease was of a severe type.

The practitioners, as a body, avail themselves of the anti-toxin provided by the Health Department. During 1935, 590,000 units of anti-toxin were so dispensed.

There is an increasing tendency to administer anti-toxin at an early stage of the disease and to suspect eases, and the majority of local practitioners are sensible of the need of adequate dosage. More reliance is now placed upon elinical evidence as an aid to diagnosis than was the ease some five or six years ago, and there is a diminishing tendency to attach undue importance to the negative swab.

SUPPLY OF ANTITOXIN TO PRACTITIONERS.

A supply of antitoxin for the use of practitioners is kept at the Health Office. A further quantity is kept at the Police Office, to which practitioners apply when the Health Office is closed.

Practitioners are advised to administer prophylactic doses of anti-toxin to immediate contacts of eases of diphtheria. On request anti-toxin is supplied free for this purpose.

ENTERIC FEVER.

Three cases of enteric fever were notified in the Borough and none terminated fatally.

PUBLIC HEALTH (INFECTIOUS DISEASES) REGULATIONS, 1927.

One hundred and eighty-one cases of acute primary and acute influenzal pneumonia were notified in 1935, compared with 163 in 1934. Forty of these eases terminated fatally, which represents a case mortality of $22 \cdot 09$, compared with $21 \cdot 47\%$ in 1934.

MEASLES.

This disease is not notifiable under the Infectious Diseases (Notification) Act.

One thousand, one hundred and ninety-two cases were brought to the notice of the Public Health Department by parents and teachers. The cases notified in previous years were: 42 in 1934; 1,994 in 1933; 68 in 1932; 447 in 1931; 1,976 in 1930; 242 in 1929; 67 in 1928; 1,272 in 1927; and 619 in 1926.

Nine deaths from measles occurred during the year.

WHOOPING COUGH.

This disease is not notifiable. Such cases as were brought to the notice of the Health Department were ascertained through the agency of teachers, school attendance officers, and the Maternity and Child Welfare Centres. The number of cases (350) was higher than in 1934, when 152 cases were notified; 7 deaths occurred from this cause, a case mortality rate of $2 \cdot 0\%$, compared with $3 \cdot 28\%$ in 1934.

DIARRHŒA.

This disease is voluntarily notifiable in Blackburn between July 1st and October 31st of each year, notification being required in respect of children under two years of age. Only seven cases were notified during the year.

Diarrhoea was certified as the cause of six deaths.

Four of the deaths were in respect of infants under one year of age; one was in the 1—2 age group, and one in the 2—5 age group.

The death rate per 1,000 births for the age group under two years was 3.52; the corresponding figure in 1934 was 4.85, and 6.17 in 1933, and 3.24 in 1932.

CHICKEN-POX.

During 1935 177 cases were notified by parents, school teachers, etc., compared with 734 cases notified in 1934, and 419 cases in 1933.

ANTHRAX.

No cases of human anthrax occurred in Blackburn during the year.

ENCEPHALITIS LETHARGICA.

During 1935 seven cases were notified as encephalitis lethargica. Six cases were certified as having died from encephalitis lethargica during the year.

No special arrangements exist for the after-care of cases of encephalitis 'lethargica, although accommodation is available at Queen's Park Hospital for this class of case.

OTHER NON-NOTIFIABLE DISEASES.

Full use is made of information received from teachers and school attendance officers respecting the occurrence of cases of measles and whooping-cough, etc. These cases are followed up and investigated by the District Sanitary Inspectors, who submit investigation reports to the Medical Officer of Health.

INFLUENZA.

Influenza was not prevalent during the year. There were 21 deaths, a figure equivalent to 0.17 deaths per 1,000 population.

TABLE 43.

SCARLET FEVER.

Two hundred and eighty-seven patients were admitted to Hospital as suffering from searlet fever. Fourteen of these patients proved to be suffering from other conditions, and one fatality occurred in this group. Of the 273 cases of searlet fever, two terminated fatally, a case mortality of 0.73%.

Anti-toxin is administered to the more severe eases, and patients are no longer detained in hospital until desquamation eeases, provided that no discharges or septic sores are present.

The following Table gives the ages and sexes of the patients admitted:-

TABLE 45.

Cases of scarlet fever arc removed to Hospital on request by the general practitioner in charge of the case. Such request is invariably reserved for cases where home isolation or nursing presents difficulty.

DIPHTHERIA.

One hundred and sixty-three cases, of which eight were from outside the Borough, were admitted to Hospital during 1935.

Twenty of these cases proved not to be diphtheria, but were suffering from the undermentioned conditions:—

The type of diphtheria prevalent throughout the year was of definitely severe type, and gave a case mortality rate of 16·1, this rate being the highest recorded during the last decade.

During the year 11 eases of laryngeal and tracheal diphtheria were admitted to the Corporation Hospital. Tracheotomy was not necessary in any of the eases.

CLEANSING OF PERSONS.

During 1935, 13 persons were dealt with at the Throstle Street Disinfecting and Cleansing Station. The conditions for which baths were given were as under :— \cdot

Scabies 8

Seven of the persons dealt with were referred from the School Medical Department. The total number of baths given was 33.

PART V.

Prevalence of,

and

Control over,

Tuberculosis.

TUBERCULOSIS.

INCIDENCE AND MORTALITY.

During the year 134 cases of Tuberculosis, 103 Pulmonary and 31 Non-Pulmonary, were notified. In 1934 the notifications numbered 110; in 1933, 108; in 1932, 114; in 1931, 210; in 1930, 191; in 1929, 155; and in 1928, 142. The notification of Tuberculosis in the area has been fairly satisfactory and there have been no cases of wilful neglect or refusal to notify.

The number of deaths in 1935 from all forms of Tuberculosis was 96; Pulmonary Tuberculosis caused 79 deaths, and Non-Pulmonary Tuberculosis 17. Ninetecn or 19·79% of the deaths from Tuberculosis were in respect of cases which had not been notified during life.

RECORDS OF PREVIOUS YEARS.

Deaths from Tuberculosis	1935	1934	1933	1932	1931	1930	1929	1928	1927	1926
Pulmonary	79	67	84	79	97	105	114	82	96	106
Non-Pulmonary	17	11	12	19	18	18	13	21	14	10

The number of deaths from all forms of Tuberculosis is equivalent to a rate of 0.80 deaths per 1,000 living.

MORTALITY RATE PER 1,000 LIVING COMPARED WITH THAT OF ENGLAND AND WALES.

1935 1934 1933 1932 1931 1930 1929 1928 1927 1926 1925 1924 1923 Blackburn...0·80 0·65 0·78 0·79 0·93 0·97 1·01 0·82 0·88 0·93 0·86 0·86 0·96 England & Wales...0·76 0·82 0·89 0·89 0·89 0·96 0·93 0·97 0·96 1·04 1·06 1·03

Perusal of the above Table shows that the death rate from all forms of Tuberculosis in Blackburn compares favourably with the corresponding rate for England and Wales.

Of the cases notified during the year 29 died, 26 of the deaths being from Pulmonary, and 3 from Non-Pulmonary disease.

The appended Table gives the age-groups of the eases notified and of the deaths for the year 1935.

TABLE 58.

		New	Cases		Deaths.				
Age Periods.	Pulm	onary	No Pulmo		Pulmo	onary.	Non- Pulmonary.

5—10 10—15	$\frac{}{2}$	1 3	6	1 1		_	3	_	
15—20 20—25	3 6	6	_ 1		1 6	4 7		1 1	
25—3 5 .,	17 11	17	1	1	8	11 6	<u> </u>	1	
35—45 ,, 45—55 ,,	10	5 7	ì	1	15	2	1		
55—65 ,, 65 and upwards	9	2	2	_	5 1	3	1	1	
Totals	 58	45	23	8	46	33	9	8	

Of eases notified during the year, the attack rate eorresponds, in the ease of males, to 1.12 per 1,000, and of females, to 0.82 per 1,000.

THE TUBERCULOSIS SCHEME.

During the year practitioners have referred 189 eases for examination at the Dispensary, and the Tubereulosis Officer has held 222 eonsultations with practitioners.

124 sputum examinations were undertaken for private practitioners and 299 in respect of patients attending the Dispensary.

During the year the Nurse made 2,502 home visits, 113 of which were in respect of ex-Service men.

The appended Table, which relates to persons who were at home during the last quarter of 1935, demonstrates the difficulty experienced in securing isolation of this type of case:—

TABLE 59.

THE TREATMENT OF TUBERCULOSIS.

At the beginning of 1935 there were 447 Pulmonary and 108 Non-Pulmonary cases on the Dispensary Register.

The Tuberculosis Notification Register is a Register of all notified cases of Tuberculosis, whereas the Dispensary Register refers only to cases actually attending the Dispensary.

During the year 232 Pulmonary and 28 Non-Pulmonary cases were added to the Register, consequently 679 Pulmonary, and 136 Non-Pulmonary cases

were dealt with during the year and 204 names were removed by reason of:—Died, 48; transferred to other areas and lost sight of, 28; Non-Tubereulous, 128.

At the end of the year there were 611 names on the register, comprising 431 Pulmonary cases, 120 Non-Pulmonary cases and 60 cases in which the diagnosis had not been completed.

Of eases on the Register on December 31st, 1935, 38 were receiving no form of treatment. The majority of these were following their ordinary occupations.

Blackburn patients are admitted either to the Sanatorium Blocks at the Corporation Hospital, or to Meathop Sanatorium, Grange-over-Sands, where the Corporation reserves ten beds. The more advanced eases are received into the Corporation Hospital, the early eases, or those which have improved under treatment at the Corporation Hospital, being drafted to Meathop.

At the beginning of the year 20 males, six females, and one child were in-patients in the Sanatorium block; during the year 65 males, 48 females, and two children were admitted; on December 31st, 1935, 25 males, 18 females and two children were still undergoing treatment. In the course of the year 49 males, 27 females and one child were discharged. Eleven males and nine females died.

During the year the average number of beds occupied by Tuberculosis eases at the Corporation Hospital was only 30·8. This was due, as in 1934 to additional beds having been required for the reception of acute infectious disorders. Arrangements are in hand to accommodate Tuberculosis patients in other sanatoria, in order to meet such contingencies as may arise in dealing with acute infectious eases.

The appended Table shows the condition of patients on discharge from the Sanatorium Block:—

			Disease Quiescent	$Much \ Improved$	$N \epsilon$	Change	e	Dead
Males		•••	 15	 24		10		11
Females	•••	•••	 6	 16	•	5	•••	9
Children			 _	 1		-		_
			_			_		_
			21	 41	• • •	15		20
								_

At the commencement of the year five males and five females were inpatients at Meathop Sanatorium, while during 1935, nine males and seven females were admitted. At the end of the year four males and six females remained at Meathop. The appended Table shows the condition of patients on discharge from Meathop:—

				Disease viescent		Much nproved	No	Change		Dead
Males	•••	•••	•••	1	•••	5	•••	2	• • •	2
Females	•••	•••	•••	_	•••	5	•••	_		1
				_		—		_		_
				1	•••	10	•••	2	•••	3
				_						_

NON-PULMONARY TUBERCULOSIS.

During the year 17 deaths were certified to be due to Non-Pulmonary Tuberculosis, compared with 11 in 1934, 12 in 1933, 19 in 1932, 18 in 1931, 18 in 1930, 13 in 1929, and 21 in 1928. The deaths were due to:—

				Male.	Female.
Tuberculous Meningitis	•••	•••	 	4	3
Bone and Joint Tuberculosis	•••		 	5	4
Intestinal Tuberculosis	• • •		 	0	1

Thirty-one eases of Non-Pulmonary Tubereulosis were notified. The diagnoses were:—

						Male.	Female.
Tuborculous Glands of Neck						10	3
Abdominal Tuberculosis						3	2
Intrathoracic Glands	•••	•••	•••		•••	1	_
Tuborculous Joint Disease					• •	5	1
Tuberculous Bone Diseaso						2	1
Tuberculous Meningitis	•••	•••	•••	•••	•••	$\frac{2}{2}$	1

BONE AND JOINT TUBERCULOSIS.

Thirty-two eases of bone or joint tuberculosis were examined by Dr. Briggs at the Special Orthopædie Clinic.

DENTAL TREATMENT OF TUBERCULOSIS PATIENTS.

The following Table gives details of Dental work carried out as part of the Tuberculosis Scheme:—

The Dental Surgeons carried out the following work in 1935:-

Number of Patients	 	 	12
Permanent Teeth extracted	 	 	17
Temporary Teeth extracted	 	 	_
Permanent Teeth Filled	 	 	2
Other Operations	 	 	Ä
Number of Sessions held	 	 	8

The following treatment was carried out at Meathop Sanatorium by the Dental Surgeon attached to that Institution. The cost of this treatment was borne by the Health Committee.

Number of Patients Treated		 	 4
Part Dentures supplied	•••	 •••	 2
Permanent Teeth Extracted		 	 12

ULTRA-VIOLET LIGHT TREATMENT.

Particulars of the Ultra-Violet Light Treatment of Tuberculosis patients will be found in Table 87.

Public Health (Prevention of Tuberculosis) Regulations, 1925.

It was not found necessary to take any action during the year under the above regulations relating to tuberculous employees in the milk trade.

PART VI.

Venereal Diseases.

VENEREAL DISEASES.

The arrangements for the treatment of Venercal Disease and for the examination of pathological material are the same as in 1934.

(a) The Royal Infirmary Centre:

Seven hundred and eighteen patients, of whom 336 were Blackburn residents, attended this Centre for the first time during the year. Of the Blackburn eases 98 were suffering from gonorrhæa, 35 from syphilis, 1 from soft chance, and 202 from conditions non-venereal.

The appended Table shows the number of new cases seen yearly at the Royal Infirmary since 1926.

Year.	Male.		Female.	Total.
1926	 260		144	 404
1927	 300		103	 403
1928	 349		291	 640
1929	 380		251	 631
1930	 365		265	 630
1931	 384	• •	269	 653
1932 ·	 440		267	 707
1933	 412		210	 622
1934	 365		315	 680
1935	 440		278	 718

The total number of attendances for all patients was 22,944, 12,445 of which were in respect of Blackburn residents. The aggregate number of inpatient days at the Royal Infirmary was 98 for Blackburn cases, and 146 for cases from other sources.

During the year 59 males and 37 females ceased to attend the Clinic before completion of the full course, and 54 cases, 28 males, and 26 females, discontinued attendance after completion of treatment, but before final tests for cure had been carried out.

(b) The Victoria Street Centre:

This centre is for the treatment of women maritally infected, and of children congenitally or accidentally infected. The Clinic forms part of the Maternity and Child Welfare Scheme, and all eases referred for treatment have passed through the Welfare Centres.

At the beginning of the year 10 females were under treatment for syphilis, and 50 females for gonorrhœa. In the eourse of the year the following cases were dealt with for the first time:—Gonorrhœa, 28; syphilis, 4; non-venereal conditions, 33. The total number of attendances made was 1,134.

FORM V.D. (R) (REVISED). RETURN relating to all persons who were treated at the Treatment Centre at the Royal Infirmary, Blackburn, during the year ended the 31st December, 1935. TABLE 72.

PART VII.

Maternity and Child Welfare.

ANTE-NATAL WORK.

An Ante-Natal Clinic is conducted twice weekly, particulars of which will be found in the appended Table:—

TABLE 74.

No. of Sessions held	•••		•••		99
No. of Attendances made	•••	• • •			2565
No. of Individuals	•••	•••			682
No. of Normal Labours	•••	•••	•	•••	388

The 57 abnormal eases were as follows:—

Instrumental		 	8	Miscarriage	 		9
Stillbirths	•••	 	11	Twins	 		4
Cæsarean Section		 •••	10	Albuminuria	 	•••	2
Premature Births		 	3	Occipito-Posterior	 		2
Breech		 	8				

In the above Table it will be noted that the number of both individuals and of attendances made was less in 1935 than in 1934. The falling off was largely due to fewer patients having been referred from Springfield for examination, since, during 1935, more Springfield patients were under the eare of their private practitioners than in 1934.

That the Clinie is not losing its place in the health scheme of the Borough is shown by the number (193) of women who attended on their own initiative, the percentage of such cases to totals attending being higher than in 1934.

Although the number of attendances has declined, the average per session has been too high for the convenience of both staff and mothers.

Clinic overcrowding will continue to prevail until extra sessions are arranged. This will be possible when the recently appointed additional medical officer begins duty.

Sixty mothers attended the clinic for post-natal examination, although no ad hoc session is held for that purpose. With the aid of the additional medical officer, it is proposed to hold such clinics.

SUPERVISION OF MIDWIVES.

Forty-four midwives notified their intention to practise during 1935. Fifteen of these are attached to the District Nurses Home.

All are trained midwives and hold the certificate of the Central Midwives Board by examination.

During the year two midwives left the Borough, leaving 42 on the register on December 31st, 1935.

One hundred and fifty-four visits were paid to the midwives' homes, of which seven were special visits, and 41 were ineffective.

Bags, ease registers, and ante-natal record books are inspected at each routine visit.

The following notifications required under the rules of the Central Midwives' Board were received:—

Notifications of s	still birth			20
,, lε	aying out dead body	•••		1
,, d	leaths in practice	•••	•••	4
,, h	aving advised artificial	feeding	• • •	18
,, li	iability to be a source of	infection		4
				_
		FOTAL		47

On two occasions the bags were found not to be satisfactory, and at four inspections the case register had not been kept up-to-date.

Ante-natal care is earried out by the midwives, but there is still room for improvement in the keeping of the ante-natal record books.

In this connection it should be stated that eloser co-operation of the midwives with private practioner or clinic would do much to raise the standard of ante-natal work as practised by them.

Lectures by obstetricians on the staffs of teaching hospitals are arranged by the Committee in order to keep the midwives in line with modern midwifery practice. These lectures have been well attended and have done much to improve the midwife's theoretical knowledge of obstetrics, and to maintain her interest in the practice of her profession. The theoretical knowledge thus acquired would be of greater value to her and to her patient were it combined with practical consultation and demonstration, either at the Clinic or in the private practitioner's consulting room.

The old suspicion that the Ante-Natal Clinic is a poaching organisation designed to divert cases from the midwife to Springfield or Queen's Park dies hard. It is true that from time to time a midwife's case is referred from the Clinic to one or other of the Blackburn Hospitals, and then only if the medical condition of the case is such as demands more specialised treatment than is possible in the ordinary household. In the interests of both patient and midwife this is obviously the only course to adopt, and although the midwife certainly forfeits the fee which she would otherwise have received from the patient, the Council pay ten shillings compensation in respect of every case so lost.

Far from being an obstructionist measure, the Clinic is designed to assist the midwife and to co-operate with her in the welfare of her patients. Although many of our midwives appreciate the advantages of such co-operation, there are some who invite medical aid only when required so to do by the rules of the Central Midwives Board. It is pertinent to ask whether many of such emergency calls would be necessary, had the midwife secured for those patients the benefit of medical advice at an earlier date.

The Committee is fully alive to the desirability of raising the standard of midwifery practice, and to this end are granting two scholarships per year, tenable at maternity hospitals, to local midwives. Each course will be of one month's duration, and at a teaching hospital. The course of instruction will comprise not only lectures and in-patient demonstrations, but will include work in the district similar to that usually undertaken by the independent midwife.

No maternal deaths took place at Springfield during the year, and only one case of notifiable puerperal pyrexia occurred.

PUERPERAL FEVER & PUERPERAL PYREXIA.

(a) Puerperal Fever:—

Six notifications were received during the year, one of which, in respect of an out-of-the-Borough case, was not investigated. Two cases terminated fatally.

The facilities available for specialist opinion in eases of puerperal fever and pyrexia and for the examination of pathological material have been described in previous reports.

Although no difficulty has been experienced in securing early hospitalisation of eases of purperal infection, the arrangements provided are somewhat disjointed and would serve a more useful purpose if unified.

Non-surgical cases of puerperal infection are admitted to the cubicle isolation block at the Corporation Hospital. It not infrequently happens that eases so admitted develop complications which call for surgical intervention. As major surgical work cannot be performed at the Corporation Hospital, such patients must be transferred either to Queen's Park or the Royal Infirmary, neither of which hospitals possess a specific puerperal fever unit.

Although such transference is necessary, the journey in the ambulance, transfer from ambulance to bed and vice-versa, the fear that her condition has deteriorated, together with the change of environment, all aggravate the mental anxiety and physical distress of the patient.

In addition to the patient, regard should be had to the disorganisation of routine at the hospital to which she has been transferred. For instance, special nursing staff must be allotted to the case, isolation arrangements have to be contrived and closely supervised, possibly at a time when both staff is short and the hospital uncomfortably full. In this connection I would express my thanks to the authorities of the local hospitals for their willing co-operation and assistance in dealing, often at great inconvenience to themselves, with this class of case.

The Maternity and Child Welfare Sub-Committee appreciate the present unavoidable deficiencies of their puerperal fever arrangements, and are aware that a more comprehensive and co-ordinated system is desirable.

To secure that co-ordination it is suggested that special accommodation for the puerperally infected be provided at the Corporation Hospital, so designed as to be capable of dealing with both surgical and non-surgical types of infection and equipped with a small theatre etc.

MATERNAL MORTALITY.

Fourteen deaths attributable to or associated with pregnancy were registered in the Borough during the year.

Eight of the deaths (one of which could not be attributed to pregnancy) were of Blackburn residents. The total number (7) of maternal deaths is equivalent to a maternal mortality rate for the Borough of 4.71.

Appended are the causes to which death was ascribed, together with comments on the circumstances leading to death. An effort has been made to classify these deaths with reference to preventability, as under:—

Group A.—Probably Preventable;

1. Certified cause of death "Myoeardial degeneration."

This patient, after six weeks hospital in-patient treatment for albuminuria, was self-discharged from hospital. Received no attention until six weeks later when, on attending the Ante-Natal Clinic, she was promptly referred to Hospital, where death took place 14 weeks later.

This death might have been prevented had the patient made fuller use of the available services.

2. Certified cause of death "Myocardial degeneration due to hyperemesis gravidarum."

Two visits to Ante-Natal Clinic (under assumed name), on each of which hospital treatment was urged for severe anaemia and debility. Hospital treatment and free milk provision declined, and no history of hyperemesis obtained. Four days after second visit to Clinic admitted to Hospital, and there gave a week's history of hyperemesis; in spite of appropriate treatment, patient died fourteen days later, following forceps delivery of still-born premature foetus.

Co-operation of this patient would probably have prevented death.

Group B.—Possibly Preventable;

1. Certified cause of death "Hæmorrhage, abortion."

Received no attention until severe haemorrhage and abortion at sixth month rendered assistance imperative. Admitted to Hospital in a moribund condition two days later, and died on day of admission.

This death might possibly have been prevented by adequate ante-natal care and/or immediate admission to Hospital following haemorrhage.

2. Certified cause of death: (a) Toxic endocarditis; (b) Puerperal septicæmia."

Eleven days before delivery, private practitioner advised hospital treatment for albuminuria. This was declined by patient. Normally delivered, with due aseptic precautions, of still-born feetus. Septicaemia developed seven days after delivery; prompt admission to Hospital; death 17 days later.

Although doubtful whether hospital treatment for albuminuria could have averted fatal issue, such treatment, by improving the general condition of the patient, would have increased her resistance.

3. Certified cause of death: "1. Uterine infection due to premature rupture of membranes. 2. Obstetric shock due to embryotomy for malposition. 3. Hyperthyroidism."

Received ante-natal care. At sixth month developed influenza; appropriate treatment given; allowed up fourteen days later and had slight haemorrhage, which ceased on return to bed. Three weeks later some loss of amniotic fluid; foetus then reported alive. One week later pyrexia and labour pains; immediately admitted to hospital, where examination showed shoulder presentation, foul discharge and high pyrexia.

Version attempted unsuccessfully under general anaesthetic. Sedative administered. Embryotomy performed fifteen hours later; macerated foetus and black placenta removed.

Fatal issue forty-eight hours later.

This death might have been prevented had the abnormal presentation and the foetal death been ascertained during the ante-natal period.

Group C.—Apparently Unpreventable;

1. Certified cause of death: "Septicæmia, puerperal infection."

Patient received every attention throughout pregnancy, but died one month after delivory.

2. Certified cause of death: "Pulmonary embolism."

This patient received overy attention throughout pregnancy and at tho time of delivery.

Developed pulmonary embolism about one hour after delivery of full-time still-born child.

This doath could not have been averted.

3. Certified cause of death: (a) Streptococcal Meningitis; (b) Chronic otitis media."

At the eighth month radical mastoidectomy. Three days later delivered of eight months child; on this date meningeal symptoms developed; death four days later.

Although this death was associated with pregnancy, it cannot be attributed to maternal processes.

Although the Corporation provides a comprehensive maternity service, their scheme cannot be considered complete until an obstetric consultant is available. This deficiency has been considered by you on various occasions and you have been aware for some time of the difficulties in the way of filling this gap. As a result of discussions with representatives of adjacent Authorities, and of the Royal Infirmary certain of these difficulties have now been surmounted and, following further negotiations, it is hoped that you will shortly be in a position to make this essential provision.

The duties attached to the proposed post will be of a consultant nature in the areas served. The person appointed will be available to assist and advise general practitioners in cases of difficulty; he will act in an advisory capacity to the participating local authorities on specialist matters affecting their maternity services, and will conduct consultant ante-natal and post-natal clinics on their behalf.

If the appointment is to prove a success it is essential that the qualifications and experience of the person appointed should ensure the full confidence of the local general practitioners, many of whom are highly skilled in the practice of obstetrics. It follows, therefore, that the post can be filled only by one of proved experience, and who, since qualification, has made a special study of midwifery.

NOTIFICATION OF BIRTHS.

The following Table illustrates the source of notifications during the year:—

		Live Births		Still Births	Total
Doctors		18		3	21
Midwives		1226		60	1286
Parents and others .	••	251		18	269
		—			
TOTALS		1495	• • •	81	1576

STILL BIRTHS.

The number of still-births registered during the year was 81. Seventeen of these were out-of-the-Borough eases. The number of still-births allocated to the Borough during the year was 64. The Borough eases were investigated with a view to ascertainment of eause. The appended Table gives particulars with reference to possible and probable eauses:—

Cause.	No. o	f Still-bi r ths.
(1) Complications of labour		13
(2) Ante-Natal Causes (including Toxæmia and Syphilis)	•••	27
(3) Fœtal States (excluding Syphilis)		16
(5) Unknown		8
		64

NEO-NATAL DEATHS.

During the year 55 infants died within two months of birth; 22 of the deaths were ascribed to fœtal states, 18 to prematurity, and 15 to post-natal eauses. The number of neo-natal deaths (i.e., within the first four weeks of life) was 46.

PREMATURE BIRTHS.

All premature births are followed up, and of 48 premature infants born during 1935, 31 or 64% were alive at the end of the year.

Causes of prematurity:

Albuminuria	ı			 	 • • •	4
Multiple pre	gnan	ey		 	 	6
Shoek		•••		 •••	 	2
Not known				 	 	28
Other Mater	nal c	onditio	ns	 	 	8

INFANTILE MORTALITY.

During the year there were 90 deaths of infants, compared with 82 in 1934. This figure corresponds to an infantile mortality rate of $63 \cdot 4$ per 1,000 live births registered, compared with $56 \cdot 9$ in 1934, and $71 \cdot 3$ in 1933.

Of the deaths registered, 84 were of legitimate, and six of illegitimate children. The rate of infantile mortality amongst legitimate infants was 61-6 per 1,000 legitimate births registered, and amongst illegitimate children, 107·1 per 1,000 illegitimate births registered.

Of the deaths eertified 46, or 51·1%, occurred within the first month of life.

The more important eauses of death were as follows:—

Cause.							Number of Deaths.
Premature Birth							18
Congenital defect	•••		•••	•••	•••	• • •	26
Pneumonia	•••	•••					16
Debility, etc	•••		•••	•••		•••	5

St. Mary's Ward shows the highest rate of infantile mortality (136), followed by St. Peter's (129), and St. Silas's (104). Trinity exhibited the lowest rate (19).

Taking the Infantile Mortality over a period of ten years, St. Silas's shows by far the best figures, St. Andrew's eomes next, followed by St. Michael's. The worst wards during the same period were St. Mary's, St. Peter's and Trinity.

MATERNITY AND CHILD WELFARE CENTRES.

There are six Maternity and Child Welfare Centres in the Borough, situated at Bent Street, Nova Scotia, Kendal Street, Griffin Parochial Hall, Cornelian Street and Hozier Street. Two sessions are held each week at Hozier Street and Kendal Street.

In the following Table it will be noted that the attendances numbered 38,897, compared with 36,974 in 1934.

TABLE 81.

	Bent Street.	Hozier Street (2 sessions weekly).	Bolton Road	Kendal Street (2 sessions weekly).	Griffin.	Cornelian Street	Total, 1935.	Total, 1934.	Total, 1933.

^{*} Total average attendance each week at all the Centres.

A doctor attends at each session, together with two Health Visitors, and assistance is given by three or four voluntary workers. To these ladies I wish to express my thanks for the enthusiastic manner in which they have performed their self-imposed duties.

Of the 1,419 live births notified during the year, 985, or $69 \cdot 4\%$, attended the Infant Consultation Centres, an increase of $1 \cdot 8\%$ over the figure for 1934.

The percentages seen by a Doctor at each session per Clinic are as under :—

Bent Street		 	 	9.0
Hezier Street		 	 	13 · 4
Nova Scotia		 	 	15.0
Kendal Street		 	 	16.6
Griffin		 	 	14.0
Cornelian Stre	et	 	 	9.0

The talks by Health Visitors at the Clinics have been continued. The syllabus is as under:—

I. Expectant Motherhood. II Care of the New-Born Infant. III The Diet of a Nursing Mother. IV Breast Feeding. V Artificial Feeding. VI Weaning. VII The Hygiene of Infaney. VIII Baby Clothes. IX The Development of the Child. X Feeding from 1–5 Years. XI Rickets. XII Common Ailments of Infaney.

The appended Table shows the deaths of babies who attended the Clinics during their first year, as compared with the deaths of those who never attended the Clinics.

1934	 		*327	435	443	†319	
			1				

^{*} Beginning of Year. † End of Year.

During the year 25,778 pounds of dried milk have been supplied to expectant and nursing mothers and young children at a cost to the Local Authority of £1,605/7/ $4\frac{1}{2}$. In 1934, 25,233 pounds were supplied at a cost of £1,558 12 $1\frac{1}{2}$. The nett cost in 1935, therefore, increased by £46 15 3.

In addition 1477 dinners were provided free, or at less than cost price for expectant or nursing mothers.

CARE OF ILLEGITIMATE CHILDREN.

No special provision is made by the Corporation for the care of illegitimate children or unmarried mothers; this work is undertaken at Viewfield Hostel by the Manchester Diocesan Association for Preventive and Rescue Work. The Health Department maintains a close co-operation with the authorities of the Hostel, and takes an active interest in the important work carried out there.

I am indebted to Miss Duckworth for the appended particulars respecting Viewfield :—

		Mothers.	Balies.
Number of Beds		12	12
Number of Cases Admitted, 1935		5	5
Number in Hostel, Jan. 1st, 1936		8	7
Number returned to relatives and friends		2	2
Number of Mothers sent to situations	• •	3	

At the end of the year there were two babies under one year. Both of these were on four-hourly bottle feeds.

The Assistant Mcdical Officer for Maternity and Child Welfare visits Viewfield at regular intervals for the purpose of inspection and consultation with the Viewfield staff.

INSTITUTIONAL PROVISION FOR MOTHERS & CHILDREN.

Maternity beds are provided at Springfield and Queen's Park Hospital.

Special accommodation is available for infants and children at both the Royal Infirmary and Queen's Park Hospital.

NURSING HOMES REGISTRATION ACT, 1927.

On receipt of application for registration under the above Act, the premises are visited by either the Medical Officer of Health or by the lady Assistant Medical Officer of Health. This visit is the occasion of a survey of the available accommodation, and advice is given as to structural or other alterations required. The number of beds to be used for the reception of eases is also decided upon. Following registration, the Homes are visited quarterly by Dr. Baird, and at more frequent intervals by the Senior Health Visitor. All have been found satisfactory.

(a) Maternity Homes:—

At the beginning of the year there were five private maternity homes in Blackburn. During the year no new homes were registered. At the end of the year five labour beds and 11 lying-in beds were available in private maternity homes.

(b) Nursing Homes:—

At the end of the year there were four registered Nursing Homes in Blackburn, providing a total of 26 beds. During the year one new home was registered.

There are now 18 Nursery Classes in Blackburn, with approximate aeeommodation for 600 ehildren under the age of five years. The work earried out at these classes has been fully described in the School Medical Report. Many of the children in attendance at these Schools have been under supervision at the Child Welfare Centres. In order to secure continuity of observation the Assistant Medical Officer for Maternity and Child Welfare, who is also Assistant School Medical Officer, undertakes the School Medical Inspection of Nursery Class children.

INFANT LIFE PROTECTION

The appended Table gives particulars of infants nursed out for reward within the Borough:—

(a)	Number of Nursed Out Children, December,	1934		14
(b)	Number of New Cases during 1935			9
(c)	Number who left the Borough during 1935			4
(<i>d</i>)	Transferred to Child's Mother	•••		1
(e)	Transferred to London (National Adoption)	•••		3
(<i>f</i>)	Transferred to Other Districts (in Borough)			2
(g)	Number at present in the Borough			13
(h)	Number found to be :—			
	(a) Satisfactory	•••		13
	(b) Unsatisfactory		•••	0

Inspection duties were undertaken by the Health Visiting Staff, who visit each case at least once in every six weeks. All the children have been found to be well cared for.

Table 87 is a composite Table which contains particulars of cases treated at both the Health Department and Hospital Clinics.

BACTERIOLOGICAL AND PATHOLOGICAL EXAMINATIONS.

Facilities are available for the examination of pathological and bacteriological specimens at the Corporation Hospital, at the Royal Infirmary, and at the Public Health Laboratories at Manchester and Liverpool.

The appended Table gives particulars of examinations carried out during 1935.

For particulars of work carried out at the Corporation Hospital Laboratory see Table 59.

LOCAL GOVERNMENT ACT, 1929.

No alterations or developments have taken place during the year.

The work of both Public Assistance and Health Committees is closely co-ordinated.

MENTAL DEFECTIVES.

The Local Authority does not provide institutional accommodation for mental defectives, nor has there been any change in the arrangements as described in the Report for 1933.

NURSING IN THE HOME.

Domieiliary nursing of cases of Measles, Whooping Cough, Diarrhea, Puerperal Fever, Ophthalmia Neonatorum, Influenzal Pneumonia, and Tuberculosis is undertaken by the District Nursing Association.

The Corporation pay the Association an annual retaining fee of £35 for these services, with an additional payment of 8d. per visit.

The appended Table gives particulars of the work earried out by the District Nursing Association in this respect during 1935:—

TABLE 89.

TOTAL	 8	111	68	32	15	4	2823

HEALTH EDUCATION.

During the year lectures (in addition to those given to school-children and their parents and those given by the Health Visitors on Mothercraft) were given by members of your staff to various religious and social organisations in the Borough.

PREVENTION OF BLINDNESS.

Beds are provided at the Corporation Hospital for the reception of selected cases of ophthalmia neonatorum; the District Nursing Association, under agreement with the Corporation, undertakes the domiciliary nursing of ophthalmia neonatorum, and during the year nursed one ease, to which 29 visits were paid.

A special school, at Roe Lee, for the care of children suffering from severe visual defect provides accommodation for 20 children.

WELFARE OF THE BLIND.

THE BLIND PERSONS ACT, 1920, SEC. 2, SUB-SECTION 1.

The Local Authority has made provision for the welfare of the blind through the Blackburn Workshops for the Blind and the Blackburn and Darwen Home Visiting Society. The Workshops are now administered by the Corporation.

In 1935 the Blind Persons Scheme cost the Corporation £4,795 allotted as under:—

Workshops for the Bline	d			• • •	£1,766.
Visiting Society	• • •				£434.
Other Blind Agencies			•••		£254.
Grants to unemployable	e necess	itous	persons		£2,263.
Professional Charges					£71.
Sundry expenses					£7.

In addition to the above grants the Workshops received £720 and the Visiting Society £180 from the Joint Finance Committee for the Blind. This Committee is composed of representatives from the Local Authorities whose districts are served by the Workshops and Visiting Society. Its function is to organise and eo-ordinate the raising of voluntary funds for the Blind.

The Blind Register contains particulars of 276 blind persons resident in Blackburn.

APPENDIX.

JEFFREY RAMSAY, M.D., M.R.C.P.,

SENIOR HONORARY PHYSICIAN,
BLACKBURN & EAST LANCASHIRE ROYAL INFIRMARY,

AND

V. T. THIERENS, M.B., CH.B., D.P.H.

In the Annual Report for 1934 reference was made to an investigation which it was proposed should be carried out regarding certain bacteriological and bio-chemical aspects of the blood during pregnancy.

Prior to outlining the nature of the investigations, we would like to express our deep indebtedness to Sir John Orr, Director of the Imperial Bureau of Animal Nutrition. The latter, at the outset of the research, loaned not only certain essential apparatus and reagents, but also seconded Dr. Auchinachie of his staff for a fortnight's duty at the Royal Infirmary Laboratory. The services of the latter were of the greatest value in simplifying and standardising an involved technique of blood analysis.

We must also express our appreciation of the assistance rendered by Dr. Colebrook, of Queen Charlotte's Maternity Hospital, who has supplied cultures of the hæmolytic streptococcus for the purposes of the bacteriological side of the investigation.

We are equally indebted to Professor Dible, of Liverpool University, and to Professor Walter MacLeod, of Leeds, for the criticism and advice so helpfully and willingly proffered by them.

Briefly, the scope of the investigation falls under two headings, bacteriological and bio-chemical, and for these purposes the blood of pregnant women at the seventh month is examined. The seventh month has been chosen as a suitable time at which to take specimens, since, at this stage, the maternal metabolic processes should be adjusted to the demands of pregnancy.

The procedure adopted is that two specimens of blood are taken from volunteers attending the ante-natal clinic. One of these specimens is collected into a sterile Behring venule and is required for bacteriological test. The second sample is used for chemical analysis.

The bacteriological side of the investigation is designed to estimate the bactericidal power (in vitro) of the serum to the causal organism of puerperal septicamia, namely, the hamolytic streptococcus. The method of examination is based upon work already done by one of us (J. R., in association with Mr. C. M. Pearee, F.R.C.S.) "Tonsil Puncture: a new method of investigation" ("British Medical Journal, 1929"), in connection with hidden tonsillar infection.

A blood eapable of dealing with the hæmolytic streptococcus in vitro should possess, in theory, the same power in vivo and its donor be consequently resistant to puerperal septicemia of hæmolytic streptococcal origin. Similarly the converse should obtain. How far practice will sustain this thesis remains to be seen.

The second sample of blood is submitted to ecrtain complicated chemical tests in order to determine the quantities of calcium, phosphorus and phosphatase which are present in it. It is important to know if these substances are present in adequate quantity in the blood during the later months of pregnancy.

Should it be found that the temperature in any ease rises above normal after delivery, or should other complications arise at that time, data will be available as to the condition of the blood prior to delivery. From such data it will be possible to arrive at a conclusion as to what faults, if any, in the matter of balanced diet, were present in the patient.

Correlation of such findings may be of great benefit to pregnant women in the future.

Careful records are kept of each case investigated, enquiry being made into such circumstances as economic and housing conditions, family expenses and dietary, the latter with special reference to milk consumption and vitamin intake. The history of the pregnancy and lying-in is also ascertained, a special note being made on the record eard of any deviation from normal as indicated by septic symptoms such as pyclitis, sapræmia, undue elevation of temperature, etc.

The results so far obtained have been of interest, although the series examined is not sufficiently large to justify, at the present, any deduction being drawn from the findings. The investigation will proceed until the numbers examined are of statistical value.
